DOOR RETAINER

MATERIAL
Aluminium Profile – Plastic end Caps.
Rubber protective arm.

DESCRIPTION

For curtain sider doors. The spring loaded retainer is polyurethanelled against a high grade steel compression spring.

The compression spring is located inside a sealed aluminium profile housing which is tightened by plastic end covers and protected against dirt and humidity by "O"rings.

The plastic cover on the front side is fitted with counter sunk stops which hold the arm in the released position and prevent it moving into a position other than that required.

The aluminium strip comes with two longitudinal channels for holding the two, infinitely adjustable fixing brackets which are screw or weld-mounted to the vehicle.

The internal parts are galvanized, smooth-running and maintenance-free. The spring loaded arm has a stroke of approx. 230 mm.
